

# AI Prompts

Presented by: Omar Alhaywan, Mohamed Rabie, Ahmed Fekry

Presented to: Dr. Sara Amin

Course: CCAS 4.3. Software Engineering

-using this last version of the requirements you will create a web application that performs all of the must and should requirements, you will create all the HTML, CSS and JS files needed for this web app, take into consideration that at one point, not yet, this web app will be linked to a local database on my machine to handle all the data such as coach data, client data and admin data whatever that may be

-I need you to make an original selection webpage where you pick what your role is, either admin, client, or coach, then after picking your role you are transferred to a new webpage that allows you to login, after you login, depending on your role one of 3 different dashboards are shown to you, each dashboard being a different webpage. Edit the code to reflect these changes

-edit the files so everything is centered in my browser window

-give me example data to log in as a client

-the dashboard is not satisfactory make it look nicer as for all of them

-I need to be redirected to the original login pages created if I select login not a new one

-these webpages will be linked to a database on my local machine that has the following tables:

**\*\*SQL file inserted\*\***

the mdf file of the database has the following directory:

D:\SQL\MSSQL16.MSSQLSERVER\MSSQL\DATA\Gym Database.mdf

first of all, I will need to insert values of a Coach if I click sign up then coach for example

-take into consideration that the CoachID in the Coaches table is sequential, starts from 1 and increments by 1 and there are already 4 coaches in the table

-I want that to happen too with the client

-okay now I want the view reports button if clicked from the admin dashboard to show the client ID their full name the name of the coach they're assigned to, the intensity of the plan they're assigned to and the name of the nutrition plan they're assigned to

-in training plan show the plan type

-give me the full view reports file

-no remove the plan type from training plan and use the field plantype of the nutrition plan

-can you change all the colors to a light purple

-in the coach dashboard change the button update training plan to create training plan which should lead to a form which creates a record in the training plan table

-remove the functionality that allows a coach to create a training plan just allow the coach to view all training plans

-remove the column plan type

-from the coach dashboard remove the button generate report and change the button monitor client progress to manage your clients' profiles which will show the coach all the clients assigned to them

-it's supposed to output the clients assigned to the coach that logged in not the clients assigned to the coach with id 1

-the client profiles shown for the coach should also contain the training plan id

-in the client dashboard when I click View training plan or view nutrition plan it should redirect me to a page that would show the full respective info of either the training plan or the nutrition plan that the logged in client it assigned to

-training plan details should not have plan type

-replace the log progress button with 2 buttons that combined have the size of the log progress button one would cancel the client's membership and change the status to Cancelled and the other would be to Re-Register which would change the membership status to Active

-okay now in the manage client profiles section instead of showing the assigned coach id it should show the name of the coach this client is assigned to and while editing a client its supposed to show a drop down list with all the coaches i can assign to the client instead of showing the assigned coach id.

-in the client dashboard there are buttons for Re-Register and Cancel membership, if the membership status is cancelled or expired then dim out the cancel membership button but if the user's status is active then dim out the re register button.

-i want on the clients dashboard to see how many days they've been subscribed to the gym which is current date - start date.

-in the coach dashboard after you click manage clients profiles allow the coach to assign training plans and nutrition plan it should also show the nutrition plans for the coach wether its in the client information or for the coach himself.
